Patterns, Functions and Algebra

Learners are going for a short holiday break but due to lost time during covid-19 school closure, they still need to continue revising their work and cover lost ground with parental support. Focus for the week is on numeric and geometry patterns. Parents should assist with basic concepts, flow diagrams, tables and number sentences. They should determine input and output values and rules for the patterns. Put more practice on single and double number operations of adding, subtracting, multiplying or dividing. Representation in physical or diagram form is recommended to make it easier for the learners. Teachers could develop worksheets to provide guidelines on how to attempt the key concepts.
